UO1.3\_ Solve the given system of linear equations using matrix inversion method

Page 5 Maharashtra State Board of Technical Education 14 August 2020

## What we will learn today

- 1. Multiplication of matrices
- 2. Transpose of a matrix

Key takeaways

Multiplication of matrices
Transpose of a matrix

Anantmati Patil Lecturer in Mathematics,

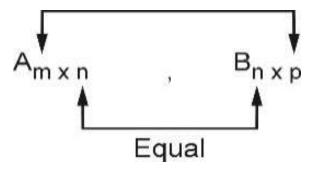

## **Matrix multiplication**

### Condition for multiplication of two matrices

The product of two matrices A and B is possible only if the **number of columns in A is equal** to the number of rows in B.

Let A =  $[a_{ij}]$  be a 'm × n' matrix and B =  $[b_{ij}]$  be a 'n × p' matrix.

then Order of  $A \times B$  is  $m \times p$ 

Page 7 Maharashtra State Board of Technical Education 14 August 2020

### Matrix multiplication

#### Method of Multiplication of two matrices:

Let 
$$A = R_1 \longrightarrow \begin{bmatrix} a & b \\ c & d \end{bmatrix}$$
,  $B = \begin{bmatrix} p & q & r \\ x & y & z \end{bmatrix}$   
 $C_1 \quad C_2 \quad C_3$ 

then 
$$AB = \begin{bmatrix} R_1C_1 & R_1C_2 & R_1C_3 \\ R_2C_1 & R_2C_2 & R_2C_3 \end{bmatrix} = \begin{bmatrix} ap + bx & aq + by & ar + bz \\ cp + dx & cq + dy & cr + dz \end{bmatrix}$$

Note:  $R_1C_1$  means multiplying the elements of first row of A with corresponding elements of first column of B.

Note: In matrices, matrix multiplication is not commutative.

i.e. 
$$A \times B \neq B \times A$$
 in general

### Word Problem/ Problem

1. If 
$$A = \begin{bmatrix} 2 & -3 \\ 4 & 0 \\ -1 & -2 \end{bmatrix}$$
,  $B = \begin{bmatrix} 3 & 4 & -1 \\ 2 & 0 & -3 \end{bmatrix}$  find i).  $A \times B$ 

ii). 
$$B \times A$$

Solution: 
$$A \times B = \begin{bmatrix} 2 & -3 \\ 4 & 0 \\ -1 & -2 \end{bmatrix} \times \begin{bmatrix} 3 & 4 & -1 \\ 2 & 0 & -3 \end{bmatrix}$$
$$= \begin{bmatrix} 6 - 6 & 8 - 0 & -2 + 9 \\ 12 + 0 & 16 + 0 & -4 + 0 \\ -3 - 4 & -4 + 0 & 1 + 6 \end{bmatrix}$$
$$= \begin{bmatrix} 0 & 8 & 7 \\ 12 & 16 & -4 \\ -7 & -4 & 7 \end{bmatrix}$$

$$B \times A = \begin{bmatrix} 3 & 4 & -1 \\ 2 & 0 & -3 \end{bmatrix} \times \begin{bmatrix} 2 & -3 \\ 4 & 0 \\ -1 & -2 \end{bmatrix}$$
$$= \begin{bmatrix} 6 + 16 + 1 & -9 + 0 + 2 \\ 4 + 0 + 3 & -6 + 0 + 6 \end{bmatrix}$$
$$= \begin{bmatrix} 23 & -7 \\ 7 & 0 \end{bmatrix}$$

### Problem/ Question Explanation and step by step Solution

2. If 
$$A = \begin{bmatrix} 2 & -1 & 0 \\ 1 & 3 & -4 \\ 5 & -3 & 4 \end{bmatrix}$$
 then find  $A^2 - 3I$ .

Solution: 
$$A^2 = \begin{bmatrix} 2 & -1 & 0 \\ 1 & 3 & -4 \\ 5 & -3 & 4 \end{bmatrix} \times \begin{bmatrix} 2 & -1 & 0 \\ 1 & 3 & -4 \\ 5 & -3 & 4 \end{bmatrix}$$

$$= \begin{bmatrix} 4-1+0 & -2-3+0 & 0+4+0 \\ 2+3-20 & -1+9+12 & 0-12-16 \\ 10-3+20 & -5-9-12 & 0+12+16 \end{bmatrix} = \begin{bmatrix} 3 & -5 & 4 \\ -15 & 20 & -28 \\ 27 & -26 & 28 \end{bmatrix}$$

$$3I = 3 \begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \begin{bmatrix} 3 & 0 & 0 \\ 0 & 3 & 0 \\ 0 & 0 & 3 \end{bmatrix}$$

### Problem/ Question Explanation and step by step Solution

3. Find x & y if 
$$\left\{4\begin{bmatrix}1 & 2 & 0\\ 2 & -1 & 3\end{bmatrix} - 2\begin{bmatrix}1 & 3 & -1\\ 2 & -3 & 4\end{bmatrix}\right\}\begin{bmatrix}2\\0\\-1\end{bmatrix} = \begin{bmatrix}x\\y\end{bmatrix}$$

Solution: Given 
$$\left\{ 4 \begin{bmatrix} 1 & 2 & 0 \\ 2 & -1 & 3 \end{bmatrix} - 2 \begin{bmatrix} 1 & 3 & -1 \\ 2 & -3 & 4 \end{bmatrix} \right\} \begin{bmatrix} 2 \\ 0 \\ -1 \end{bmatrix} = \begin{bmatrix} x \\ y \end{bmatrix}$$

$$\begin{bmatrix} 2 & 2 & 2 \\ 4 & 2 & 4 \end{bmatrix} \begin{bmatrix} 2 \\ 0 \\ -1 \end{bmatrix} = \begin{bmatrix} X \\ y \end{bmatrix}$$

$$\therefore \begin{bmatrix} 4+0-2\\8+0-4 \end{bmatrix} = \begin{bmatrix} X\\y \end{bmatrix}$$

$$x = 2$$
 and  $y = 4$ 

#### Transpose of a matrix:

**Definition**: The transpose of a matrix A is a matrix obtained by interchanging the rows and columns of matrix A. It is denoted by A' or  $A^{t}$  or  $A^{T}$ 

For e.g.: If 
$$A = \begin{bmatrix} a & b & c \\ p & q & r \end{bmatrix}$$
 then  $A' = \begin{bmatrix} a & p \\ b & q \\ c & r \end{bmatrix}$ 

### Properties:

- (A')' = A
- (A + B)' = A' + B'
- $(A \times B)' = B' \times A'$
- ▶ If  $A \times A' = A' \times A = I$  then A is called orthogonal matrix.

### Course Content

### **Symmetric Matrix**:

**Definition**: In a matrix A, if  $a_{ij} = a_{ji}$  for all i and j then matrix is known as symmetric matrix i.e. if A = A' then matrix is known as symmetric matrix.

For e.g. 
$$A = \begin{bmatrix} 1 & 2 & -4 \\ 2 & 5 & 3 \\ -4 & 3 & 9 \end{bmatrix}$$

### Skew Symmetric Matrix:

**Definition**: In a matrix A, if  $a_{ij} = -a_{ji}$  for all i and j then matrix is known as skew symmetric matrix i.e. if A = -A' then matrix is skew symmetric matrix.

For e.g. 
$$A = \begin{bmatrix} 0 & 2 & -3 \\ -2 & 0 & 5 \\ 3 & -5 & 0 \end{bmatrix}$$

### Word Problem/ Problem

1. If 
$$A = \begin{bmatrix} 2 & -3 \\ 1 & 5 \end{bmatrix}$$
 and  $B = \begin{bmatrix} 3 & -1 & 2 \\ 1 & 0 & 1 \end{bmatrix}$  then verify that  $(AB)' = B'A'$ 

#### Solution:

$$A = \begin{bmatrix} 2 & -3 \\ 1 & 5 \end{bmatrix} \quad \text{and} \quad B = \begin{bmatrix} 3 & -1 & 2 \\ 1 & 0 & 1 \end{bmatrix}$$

$$A' = \begin{bmatrix} 2 & 1 \\ -3 & 5 \end{bmatrix} \quad \text{and} \quad B' = \begin{bmatrix} 3 & 1 \\ -1 & 0 \\ 2 & 1 \end{bmatrix}$$

$$AB = \begin{bmatrix} 2 & -3 \\ 1 & 5 \end{bmatrix} \begin{bmatrix} 3 & -1 & 2 \\ 1 & 0 & 1 \end{bmatrix}$$

$$= \begin{bmatrix} 6-3 & -2+0 & 4-3 \\ 3+5 & -1+0 & 2+5 \end{bmatrix}$$

$$AB = \begin{bmatrix} 3 & -2 & 1 \\ 8 & -1 & 7 \end{bmatrix}$$

$$(AB)' = \begin{bmatrix} 3 & 8 \\ -2 & -1 \\ 1 & 7 \end{bmatrix} \qquad \dots (i)$$

$$B' A' = \begin{bmatrix} 3 & 1 \\ -1 & 0 \\ 2 & 1 \end{bmatrix} \begin{bmatrix} 2 & 1 \\ -3 & 5 \end{bmatrix} = \begin{bmatrix} 6-3 & 3+5 \\ -2+0 & -1+0 \\ 4-3 & 2+5 \end{bmatrix}$$

$$B' A' = \begin{bmatrix} 3 & 8 \\ -2 & -1 \\ 1 & 7 \end{bmatrix} \qquad \dots (ii)$$

From (i) and (ii) 
$$(AB)' = B' \cdot A'$$

Set 1: Question No 1	Set 1: Question No 2	Set 1: Question No 3
State the order of the product matrix	State the order of the product matrix	State the order of transpose of matrix
$A \times B$ if matrix A is of order $2 \times 3$ and	$B \times A$ if matrix A is of order $2 \times 2$ and	
matrix B is of order $3\times3$ .	matrix B is of order 3×3.	$\begin{bmatrix} 2 \\ 1 \\ 3 \end{bmatrix}$
